## EDITORIAL NOTE

**Jurnal Psikologi Vol. 19 No. 4 December 2020**

Welcome to the December 2020 edition. In this edition, you will read eight selected articles that have gone through extensive reviews from reviewers.

From developmental and cognitive issues, **Aryanto**, in his study, aims to determine the dual-coding method on long-term memory in two levels of education: primary school and university. Among 60 primary school students and 81 university students, the study found that the dual-coding method affects primary school students' long-term memory but not university students. It highlighted that the age range has a significant effect on the long-term memory ability of individuals.

**Maba and his colleagues** are interested in measuring *sorogan* motivation on Islamic boarding school students (*santri*). They provide adaptation processes, testing the validity and reliability of the Academic Motivation Scale *Sorogan* Version (AMS-VS). The results showed that the scale is a proper and robust measurement to determine the level of *sorogan* motivation of the *santri*.

From a university perspective, **Husna and Akmal** report on the psychometric properties of the revised version of Skala Karakter Wirausaha (SK-Wira) administered to university students in Magelang and Makassar. This study found the scale can be used to measure general entrepreneurial character. It also correlated with the hope of success, fear of failure, openness to experience, neuroticism, entrepreneurial intention, and entrepreneurial self-efficacy.

Furthermore, some articles specifically address topics related to the industry, health, and forensic psychology. From the industrial area, **Juniarly and her colleagues** determine the contribution of work-family conflict and social support in predicting marriage satisfaction among Eighty-seven female workers at the Bank. They found the significant role of work-family conflict and social support on marital satisfaction. This study then explains the importance of companies making policies that emphasize the importance of work-family balance and provide opportunities for employees to adopt policies that help balance their work-life and family life. Besides, companies can also offer support by developing a work culture that supports family life. From the health area, **Hamzah and Subandi**, in their qualitative study, want to explore the lived experiences of psychosocial dynamics of hypertension in patients with low socioeconomic status. This study found six superordinate themes that focused on perceptions of causes, perceptions of hypertension, unpleasant feeling, social resources, improvement efforts, and health development. Further, Perception of the cause or disease itself then creates an unpleasant feeling that encourages improvement or coping.

From the forensic psychology area, **Wilona and her colleagues** investigated the differences between Adverse Childhood Experience (ACE) on violent crimes and non-violent crimes among juvenile offenders in the Juvenile Detention Center in Blitar. The resulting study showed that offenders with ACE were higher on violent crimes than the non-violent crimes group. **Cahyaningrum and Margaretha** try to examine the effects of emotional congruence and compulsive sexual behavior on the re-offend risk prediction of child molesters on a different criminal case. This study was conducted on 111 convicted child molesters from 5

prisons in East Java. The result showed that age and distress on daily functioning dimensionally from compulsive sexual behavior were significant impacts re-offend risk prediction.

Further, in a specific context, **Puteri and her colleagues** investigate how kindness conducted by the group, the definition of violations, and the value of doing good can affect moral credentials in the form of the leniency of punishment for corruptors. This study uses a population-based survey method that involves 319 polices and doctors divided into two segments. This research proves a correlation between violation definition, presence of the victim, and punishment. Perpetrator and group give inconsistent explanation toward gratification behavior. Therefore, they suggest that receiving gratification does not correlate with cultural practices of respecting others, but must be interpreted as a value of bad intention, so it deserved severe punishment.

We hope you enjoy the articles presented and find meaningful things. Our gratitude goes to all contributors, reviewers, editors, and assistant editors.
